

**Modelling Uncertainty
in Electricity Capacity Planning**

Anne Ku

**Thesis submitted to the University of London
for the degree of Doctor of Philosophy**

London Business School

February 1995

ABSTRACT

Capacity planning has always been subject to major uncertainties, but privatisation of the U.K. electricity supply industry (ESI) has introduced the additional risks of business and market failure. To meet these broader modelling requirements, two radically different approaches characterised by *model synthesis* and *flexibility* are investigated.

Ideally, by using more than one technique, model synthesis should be more capable of meeting the conflicting criteria of comprehensibility and comprehensiveness. The noticeable trend of building bigger energy models supports this view in practice. A case study based modelling experiment was conducted to compare replications of traditional approaches with prototypes of synthesis. The conclusion from this is that the pursuit of greater model comprehensiveness through model synthesis is an elusive and ultimately impractical objective.

Rather than rigorous modelling for completeness, flexibility introduces an entirely different treatment of uncertainty. Flexibility has received much attention lately, but its usefulness is under-researched in modelling uncertainty for this context. In this respect, flexibility is studied 1) as a decision criterion, 2) as a feature of the modelling approach, and 3) in contrast to robustness.

Although intuitively appealing, flexibility is a vague and multi-faceted concept that requires much clarification before further application. A cross disciplinary review identifies its close relationships with more established concepts, the conditions under which it is useful, and the necessary elements in its definition. These elements translate into indicators for measuring and modelling flexibility. Practical guidelines for the operationalisation, structuring, and assessment of flexibility are developed from this conceptual framework and supported by examples specific to the UK ESI.

The seemingly feasible answer of model synthesis is fraught with conceptual and operational difficulties. The less obvious concept of flexibility offers a more promising and useful framework. Instead of modelling uncertainty for completeness, this thesis promotes modelling flexibility for contingency.

To my parents,

James and Lucy,

complementary but not always compatible

ACKNOWLEDGEMENTS

Writing this thesis was like putting together a big jigsaw puzzle. Without the clues along the way, the final picture might have appeared much later and perhaps fuzzier. I would like to thank the kind individuals, who supplied these clues and some of the missing pieces.

First of all, I thank my supervisor Derek Bunn, for his patience and wisdom in guiding me to the final end and his sustained interest as my thesis evolved. I would also like to thank Kiriakos Vlahos for suggesting the idea of flexibility in the first place and his considerable help and feedback on various stages of my research.

I would like to thank the following individuals for intellectual input: Hans Christian Reinhardt for stimulating discussions on the concept of flexibility and my research as a whole; François Longin for application of flexibility and robustness; Jonathan Levie and Mike Staunton for detailed comments on writing and content; Isaac Dyner for feedback on model synthesis; and Stephen Watson for clarification of the initial literature review on flexibility.

On financial support, I acknowledge the PhD Programme's generous contribution towards my tuition in the early years and fees for conferences (Kiel, DC, and Berlin). I am also grateful for the support of the Overseas Research Scholarship, Decision Sciences Teaching Scholarship, Energy Scholarship, and Decision Sciences Faculty for conferences (Lancaster, Cologne, and York).

I would like to thank the LBS Library staff, in particular, John Hall and Lynne Powell for inter-library loans. I am also deeply grateful to my friend Zakia Mehdi for lending me her notebook computer in the final stages and Eduardo Ayrosa for configuring it to my specifications. I also acknowledge the advice and encouragement of other colleagues and friends who have shared the PhD experience with me.

Finally, I thank Dave Woodhouse, for emotional support.

Chance favours the prepared mind.

- Louis Pasteur (1822 - 1895)
